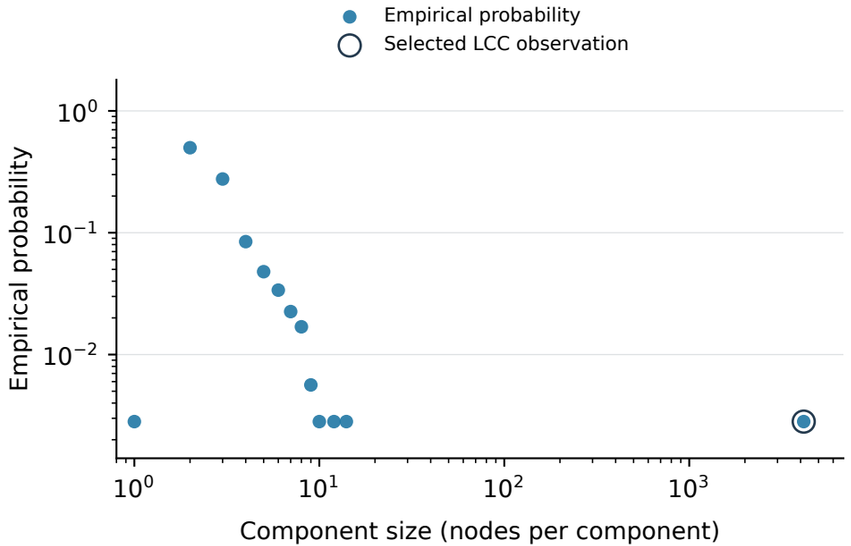
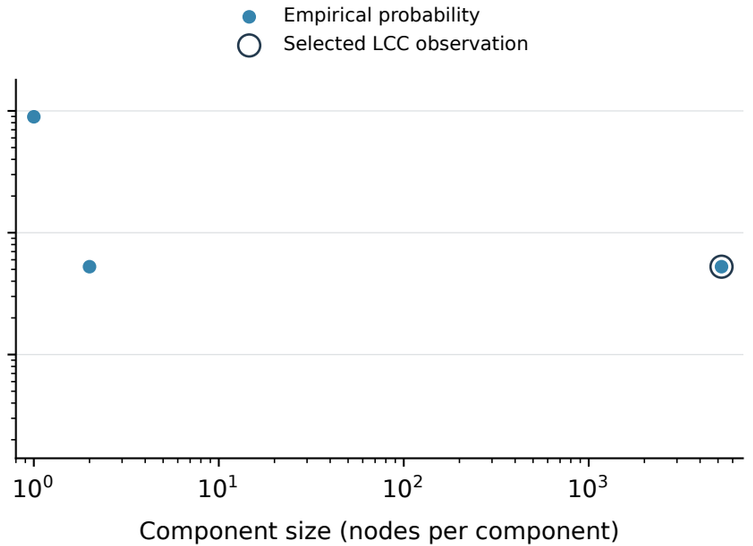
ca-GrQc | Connected-component size distribution

(a) Real | grqc_real
N=5,242, M=14,484; observations=355



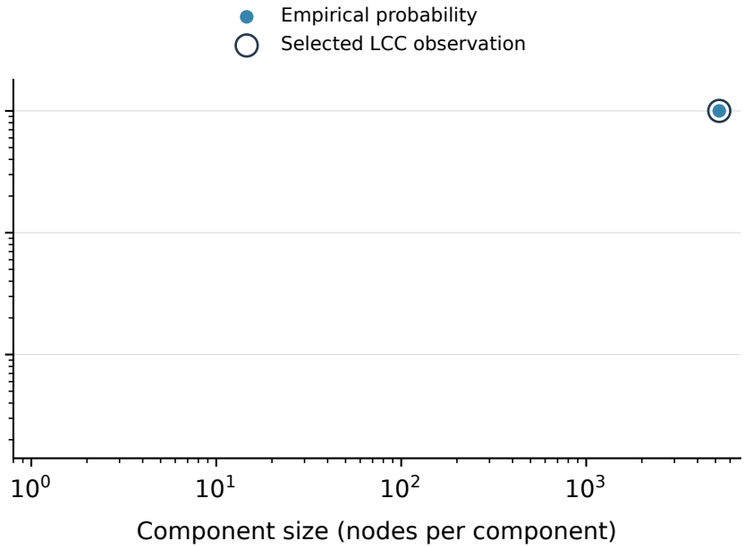
Fit N/A: Candidate mismatch: best KS=0.124 exceeds the descriptive screen, or optimization is boundary-limited.

(b) ER | grqc_er
N=5,242, M=14,176; observations=19



Fit N/A: Only 18 observations or fewer than three distinct values; no stable parametric fit.

(c) BA | grqc_ba
N=5,242, M=15,717; observations=1



Fit N/A: One component: one observation and zero variance; fitting a shape is not meaningful.

Discrete PMF = count / observations; component observations are unweighted components, not nodes. Zero-valued observations are retained; empty-frequency bins are saved but not drawn on logarithmic y axes. Fits/smoothers are descriptive, not significance tests.
